Component: CRUD error

One component for every Admin save that the database rejects. It receives the DB error and turns it into a clear reason the change did not happen, in plain words. It sits at the top of the add or edit form, and the related fields are marked.

DESKTOP (in the details panel, full width of the form)

1 2 **[Error title]** 6

! 3 [Friendly message built from the DB error. Says what is wrong and how to fix it.] X

4 Conflicts with: [Conflicting record]

5 **[Primary action]** Dismiss

ANATOMY

1 **Icon**
Always "!" in a circle, so it does not rely on color.

2 **Title**
From the error code (table below). Short, says what happened.

3 **Message**
Plain words: why it was not saved and how to fix it. No codes or technical terms.

4 **Conflicting record**
Optional. Link to the existing row named in the DB detail.

5 **Actions**
Primary action that helps fix it, plus Dismiss.

6 **Close**
Same as Dismiss. Form values are kept.

MOBILE (top of the form screen)

! **[Error title]** X

[Friendly message built from the DB error. Says what is wrong and how to fix it.]

Conflicts with: [Conflicting record]

[Primary action] Dismiss

FIELD MARKER

[Field label]

[Value]

! [Short field message]

HOW THE MESSAGE IS CHOSEN (for developers, never shown to the admin)

DB error code	Title shown	Example	Primary action
`23505 unique_violation`	[Item] already exists	Duplicate role, permission, beacon assignment	Open existing
`23P01 exclusion_violation`	[Location] already booked	Schedule overlaps in the same location	View booking
`23503 foreign_key_violation`	[Item] is still in use	Delete a period that has schedules	View where used
`23514 check_violation`	Value not allowed	End time before start time	Fix field
`Other / unknown`	Could not save	Any unmapped DB error	Try again

Behaviour
Shows after Save fails. Nothing is saved, and the form keeps what was typed. Focus moves to the component and the screen reader reads the title.

Fields
The constraint name maps to the form fields it covers (e.g. class_schedule_no_overlap marks Location, Start and End). Editing a marked field clears its marker.

Fallback
If the error is not in the table, show "Could not save" with "Something went wrong. Check the details and try again." The raw error is logged, never shown.
